

# Introduction to AI Coursework Part 2

Runze Yuan 2217498

May 22, 2023

## 3.2 Composition

1. **What do the instances that comprise the dataset represent (e.g., documents, photos, people, countries)**

The instances in the dataset consist of images described by nouns modified by adjectives. e.g., broken clock, diced chicken, fresh tomato, young elephant, etc.

2. **How many instances are there in total (of each type, if appropriate)?**

The dataset comprises a total of 2,207 adjective-noun combinations of 245 nouns and 115 adjectives. Each adjective-noun pair is associated with fewer than 50 images, resulting in a total of 63,440 images.

3. **Does the dataset contain all possible instances or is it a sample (not necessarily random) of instances from a larger set?**

Each instance (adjective-noun pair) in the dataset contains a limited number of images, specifically fewer than or equal to 50 images.

4. **What data does each instance consist of?**

Each instance contains a certain number of images that correspond to the description of that particular instance (adjective-noun pair).

5. **Is there a label or target associated with each instance?**

The labels of this dataset are the names (adjective-noun pairs) of the instances themselves. Each image is described by an adjective-noun pair.

6. **Is any information missing from individual instances?**

Each instance contains fewer than or equal to 50 images.

7. **Are relationships between individual instances made explicit (e.g., users' movie ratings, social network links)?**

The instances are generated by combining a series of nouns with a fixed set of adjectives, and invalid combinations (e.g., "thin milk") have been removed from the dataset with the N-gram possibility generated by Microsoft Web N-gram Services

<sup>1</sup>. Each individual noun is only modified by  $\sim 9$  adjectives it affords.

8. **Are there recommended data splits (e.g., training, development/validation, testing)?**

No.

9. **Are there any errors, sources of noise, or redundancies in the dataset?**

All instances were cleaned by humans to remove poor quality and mislabeled images. Note, however, that the dataset still contains some mislabeled and ambiguous images.

10. **Is the dataset self-contained, or does it link to or otherwise rely on external resources (e.g., websites, tweets, other datasets)?**

Yes, the dataset is self-contained.

11. **Does the dataset contain data that might be considered confidential (e.g., data that is protected by legal privilege or by doctor–patient confidentiality, data that includes the content of individuals’ non-public communications)?**

No. (All data was collected through Bing searching results.)

12. **Does the dataset contain data that, if viewed directly, might be offensive, insulting, threatening, or might otherwise cause anxiety?**

No. (The dataset does not include any adjectives that are offensive or disrespectful).

### 3.3 Collection Process

1. **How was the data associated with each instance acquired?**

Scrape up to 50 images from Bing by explicitly querying {adj, noun} pair, in addition to querying by only noun. Then have human labelers removed any images in a noun category that did not depict the noun.

2. **What mechanisms or procedures were used to collect the data (e.g., hardware apparatuses or sensors, manual human curation, software programs, software APIs)?**

Bing searching and manual human correction.

3. **If the dataset is a sample from a larger set, what was the sampling strategy (e.g., deterministic, probabilistic with specific sampling probabilities)?**

No sampling strategy (if selecting images from Bing search results can be considered a form of sampling).

4. **Who was involved in the data collection process (e.g., students, crowdworkers, contractors) and how were they compensated (e.g., how much were crowdworkers paid)?**

The raw data was cleansed with online crowd sourcing service.

**5. Over what timeframe was the data collected?**

In the year 2015.

**6. Were any ethical review processes conducted (e.g., by an institutional review board)?**

No.

**7. Did you collect the data from the individuals in question directly, or obtain it via third parties or other sources (e.g., websites)?**

Through internet (Bing search engine).

**8. Were the individuals in question notified about the data collection?**

This question is not applicable to this dataset (the dataset does not include photographs of individuals).

**9. Did the individuals in question consent to the collection and use of their data?**

This question is not applicable to this dataset (the dataset does not include photographs of individuals).

**10. If consent was obtained, were the consenting individuals provided with a mechanism to revoke their consent in the future or for certain uses?**

This question is not applicable to this dataset (the dataset does not include photographs of individuals).

**11. Has an analysis of the potential impact of the dataset and its use on data subjects (e.g., a data protection impact analysis) been conducted?**

No.

## **3.5 Uses**

**1. Will the dataset be distributed to third parties outside of the entity (e.g., company, institution, organization) on behalf of which the dataset was created?**

The dataset is freely accessible to the general public.

**2. How will the dataset will be distributed (e.g., tarball on website, API, GitHub)?**

The distribution is carried out through the following website:

[http://web.mit.edu/phillipi/Public/states\\_and\\_transformations/index.html](http://web.mit.edu/phillipi/Public/states_and_transformations/index.html).

**3. When will the dataset be distributed?**

2015.

**4. Will the dataset be distributed under a copyright or other intellectual property (IP) license, and/or under applicable terms of use (ToU)?**

No.

5. Have any third parties imposed IP-based or other restrictions on the data associated with the instances?

No.

6. Do any export controls or other regulatory restrictions apply to the dataset or to individual instances?

No.
